

# An Introduction to Data Analysis using R

**Dr. Calum Webb**

Sheffield Methods Institute, the University of Sheffield

[c.j.webb@sheffield.ac.uk](mailto:c.j.webb@sheffield.ac.uk)

**This is going to be a hands-on training course: all of the information that you need is included in the materials, rather than being split across the slides and the exercises.**

# R compared to software for Data Analysis

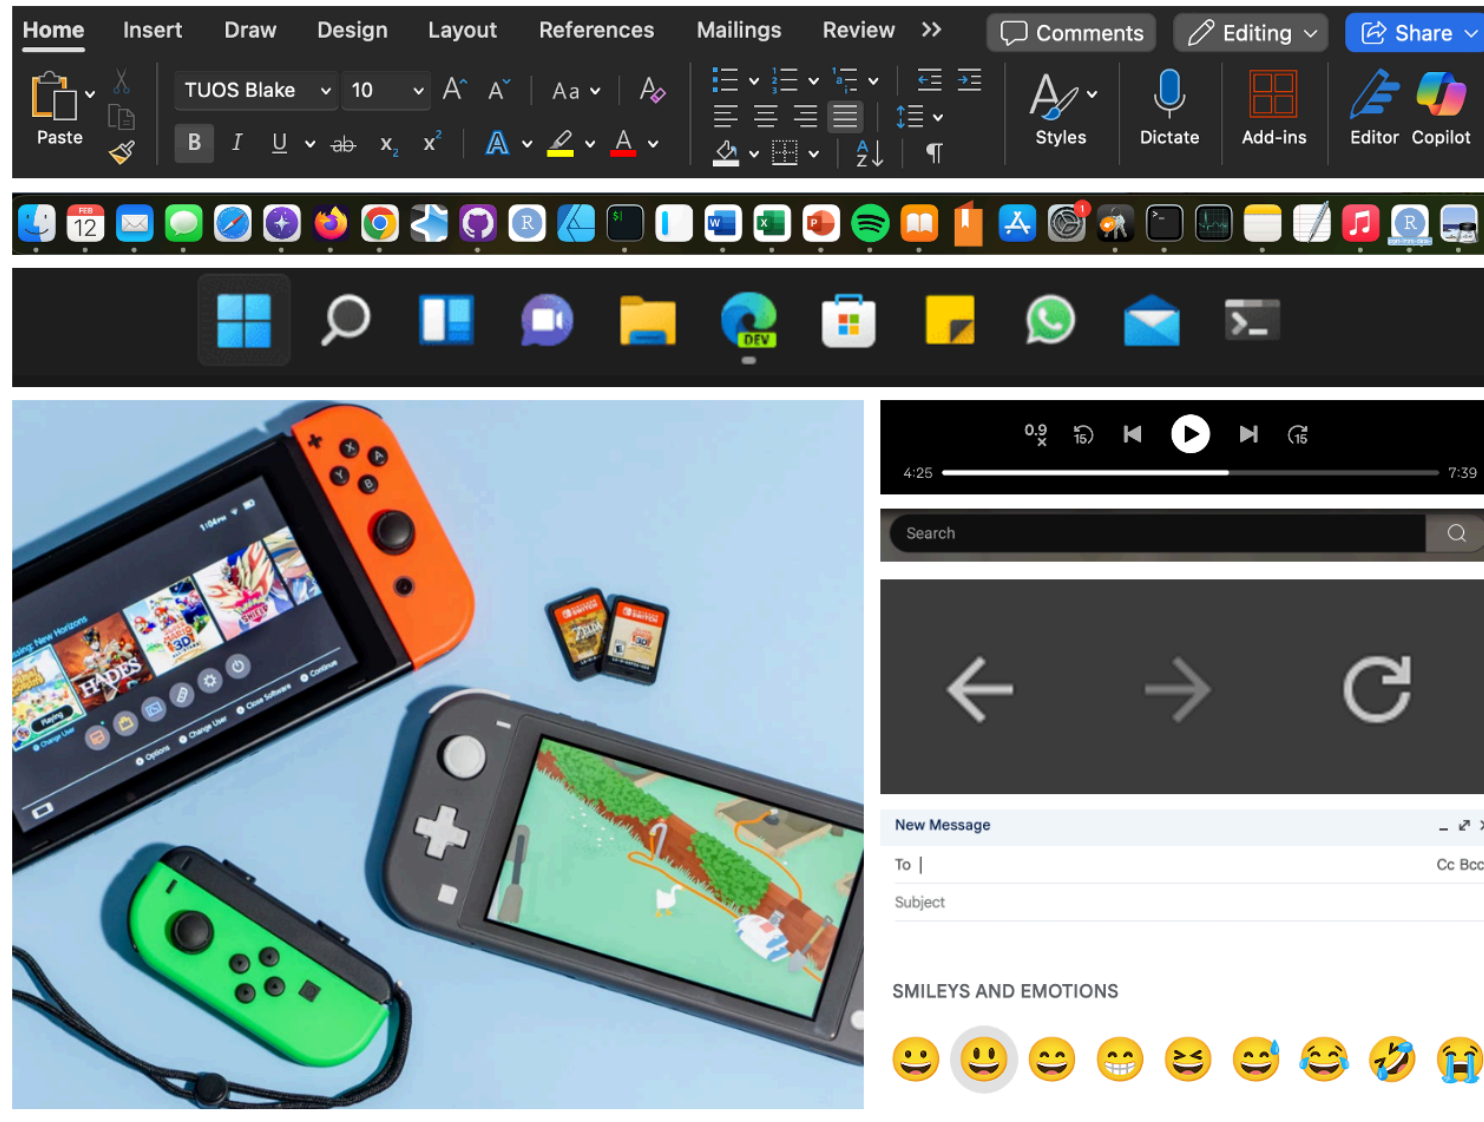

- **R** is a programming language, rather than just a piece of software.
- **R** has a central repository that holds packages that can expand what you are capable of doing with it.
- **R** is free.
- **R** has a very supportive and active community around it.
- **R** can do pretty much everything that any commercial software package can do, with a few very niche exceptions..

"But I'm not a programmer, I never studied computer science/mathematics/intro to programming before"

# If you can use a computer, you can program.

- It's not difficult, it's different. Getting used to something different takes time.
- Instead of clicking virtual or real buttons that apply functions (i.e. make things happen), we give commands by writing text.
- They are called **languages** for a reason — they have their own rules, grammar, and syntax — you have to practice them to get good at them.
- **But**, that doesn't mean you can't use phrasebooks, especially if you only use the language occasionally.

```
open.spotify()
```

```
search.playlists(search = "instrumental")
```

```
play.playlist(playlist = "Instrumental Studying  
Mix")
```

```
skip.track()
```

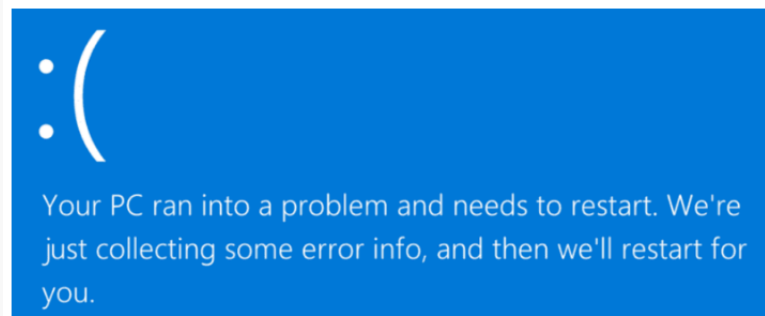

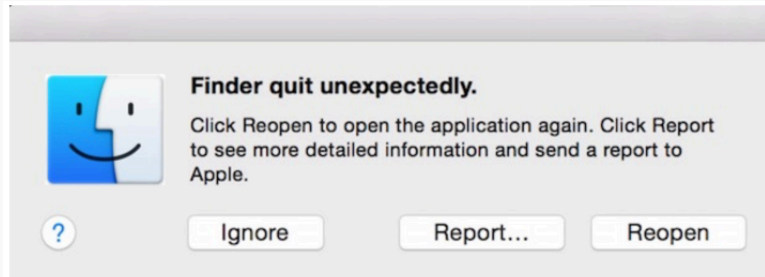

```
rewind.track(seconds = 20)
```

```
add.track.to.favourites()
```

```
stop()
```

```
quit.spotify()
```

```
> read.csv("testdat.csv")
Error in file(file, "rt") : cannot open the connection
In addition: Warning messages:
1: In prose_index(x) : Code fences are not balanced
2: In prose_index(x) : Code fences are not balanced
3: In file(file, "rt") :
  cannot open file 'testdat.csv': No such file or directory
> |
```

### Search suggestions

Check your spelling  
Try more general words

Did you mean:

We get errors all the time when using computers. The only difference between the errors you just saw and R errors is that the R errors are at least trying to tell you what went wrong.

If you've ever used the "back" < or "undo" ↶ button, change something, and then do it again to get the result you want — congratulations, you've corrected an error.

# What we're going to cover today:

- A general rule for using code in R: things you have to change and things that stay the same.
- Basic univariate and bivariate descriptive statistics using Base R
- Basic data visualisations using base R
- Common bivariate inferential statistics using base R
- Installing additional packages
- Reading datasets into R, including SPSS datasets
- Descriptive statistics using **tidyverse** and **janitor** tools
- Data visualisations using **ggplot2**

This is your phrasebook to help you on your R learning journey.
